

Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims

Claims 1-9. (Canceled)

Claim 10. (New) A method of preparing an electric double layer capacitor, comprising preparing carbon fibers by:

(i) carbonizing a mesophase pitch based infusibilized fiber at 600° to 900°C,

(ii) activating the thus obtained carbon fiber in the presence of alkali, thereby obtaining a meso-phase pitch based active carbon fiber having a BET specific surface area of 30 to 1000 m²/g whose pores consist essentially of micropores having an average pore radius of 0.2 to 1 nm;

forming positive and negative electrode material by formulating a mixture of said activated carbon fibers, conductive carbon black and a binder and applying the mixture to a solid conductive metal support;

positioning the positive and negative electrodes so formed in non-contacting relationship in a container with an electrolyte; and subjecting the positive and negative electrodes to a charge/discharge treatment in which the capacitor is charged at constant current density at a gradually increasing voltage until the voltage exceeds 2.5 V up to 3.5 V, thereby forming an electric double layer at the interfaces of the electrodes of the capacitor and the electrolyte and thereafter discharging the capacitor at a constant current density.

Claim 11. (New) A method of increasing the charge/discharge capacities of activated

carbon fiber for an electric double layer capacitor, comprising:

- (i) carbonizing a mesophase pitch based infusibilized fiber at 600° to 900°C,
- (ii) activating the thus obtained carbon fiber in the presence of alkali, thereby obtaining a meso-phase pitch based active carbon fiber; and
- (iii) immersing the thus obtained carbon fiber in an electrolyte in which a current is applied at constant current density and at a gradually increasing voltage until the voltage exceeds 2.5 V up to 3.5 V to the mesophase pitch based active carbon fiber with the result that an electric double layer is formed at an interface of the mesophase pitch based active carbon fiber and the electrolyte to thereby effect charging, and thereafter discharging the capacitor at a constant current density.

Claim 12. (New) The method as claimed in Claim 11, wherein the activated carbon fiber has a BET specific surface area of 30 to 1200 m²/g.

Claim 13. (New) The method as claimed in Claim 11, wherein the activated carbon fiber has an average pore radius of 0.2 to 1 nm.
